

## Electronic Circuit Protection ESX10-TC 12VDC

Electronic circuit protection type ESX10-TC is designed to ensure selective disconnection of 12VDC load systems.

12VDC power supplies, which are widely used in industry today, will shut down the output in the event of an overload with the result that one faulty load in the system can lead to complete disconnection of all loads.

Through selective disconnection the ESX10-TC responds much faster to overload or short circuit conditions than the switch-mode power supply. This is achieved by active current limitation. The ESX10-TC limits the highest possible current to 1.3 to 1.8 times the selected rated current of the circuit protector. Thus it is possible to switch on capacitive loads of up to 20,000  $\mu\text{F}$ , but they are disconnected only in the event of an overload or short circuit.

For optimal alignment with the characteristics of the application the current rating of the ESX10-TC can be selected in fixed values from 1.0 A...10 A. Failure and

status indication are provided by a multicolor LED and an integral short-circuit-proof status output or a relay signal contact. Remote operation is possible by means of a remote reset signal or a remote ON/OFF control signal. The manual ON/OFF button allows separate actuation of individual load circuits.

The ESX10-TC, with a width of only 12.5 mm, can be snapped onto symmetrical rails for easy installation and control cabinet space savings.

**Upon detection of overload or short circuit in the load circuit, the MOSFET of the load output will be blocked to interrupt the current flow. The load circuit can be re-activated via the remote electronic reset input, control input or manually by means of the ON/OFF button.**

### Features

- Selective load protection, electronic trip characteristics
- Active current limitation for safe connection of capacitive loads up to 20,000  $\mu\text{F}$  and on overload/short circuit
- Current ratings 1 A...10 A at 12VDC
- Reliable overload disconnection with  $1.1 \times I_n$  plus, even with long load lines or small cable cross sections (see table 3)
- Manual ON/OFF button (S1)
- Control input IN+ for remote ON/OFF signal (option)
- Electronic **reset** input RE (option)
- Clear status and failure indication through LED, status output SF
- Integral fail-safe element adjusted to current rating
- Width per unit only 12.5 mm
- Rail mounting
- Ease of wiring through busbar LINE+ and 0 V
- Hazardous area approved– Class1 Div 2, Zone 2 (ATEX)

Load circuit	
Load output	Power-MOSFET switching output (high side switch)
Overload disconnection	typically 1.1 x I <sub>N</sub> (1.05...1.35 x I <sub>N</sub> )
Short-circuit current I <sub>K</sub>	active current limitation (see table 1)
Trip time for electronic disconnection	see time/current characteristics typically 3 s at I <sub>Load</sub> > 1.1 x I <sub>N</sub> typically 3 s...50 ms at I <sub>Load</sub> > 1.8 x I <sub>N</sub> (or 1.5 x I <sub>N</sub> /1.3 x I <sub>N</sub> )
Temperature disconnection	internal temperature monitoring with electronic disconnection
Low voltage monitoring load output	with hysteresis at voltage dips < 500 ms, no reset required: load "OFF" at U <sub>B</sub> < 3.2 V
Starting delay t <sub>start</sub>	typically 10 ms
Disconnection of load circuit	electronic disconnection
Free-wheeling circuit	external free-wheeling diode recommended with inductive load

Several load outputs must not be connected in parallel

## Technical data (T<sub>ambient</sub> = 25°C, operating voltage U<sub>S</sub> = 12VDC)

Status output SF	
Electrical data	<b>ESX10-TC-114/-124/</b> plus-switching signal output, connects U <sub>S</sub> to terminal 12 of module 17 plus nominal data: 12VDC / max. 0.2 A (short circuit proof) status output is internally connected to GND with a 10 kΩ resistor
Status OUT	ESX10-TC-114/-124 (signal status OUT), +12 V = S1 is ON, load output connected through 0V = S1 is ON, load output blocked and/or switch S1 is OFF red LED lit
OFF condition	0 V level at status output when: <ul style="list-style-type: none"> <li>• switch S1 is in ON position, but device is still in switch-on delay</li> <li>• switch S1 is OFF, or control signal OFF, device is switched off</li> <li>• no operating voltage U<sub>S</sub></li> </ul>
Reset input RE	
Electrical data	<b>ESX10-TC-124</b> voltage: max. +32VDC high > 4.5VDC ≤ 18VDC low ≤ 2.5VDC > 0 V power consumption typically 1.4 mA (+12VDC) min. pulse duration typically 10 ms
Reset signal RE (terminal 22)	The electronically blocked ESX10-TC-124 may remotely be reset via an external momentary switch due to the falling edge of a +12 V pulse. A common reset signal can be applied to several devices simultaneously. Switched on devices remain unaffected.
Control input IN+	
Electrical data	see reset input RE
Control signal IN+ (terminal 21)	+12V level (HIGH): device will be switched on by a remote ON/OFF signal 0 V level (LOW): device will be switched off by a remote ON/OFF signal
Switch S1 ON/OFF	unit can only be switched on with S1 if a HIGH level is applied to IN+

Attention: when mounted side-by-side without convection the ESX10-TC should not carry more than 80% of its rated load with 100% ON duty due to thermal effects.

Please note:

- The user should ensure that the cable cross sections of the relevant load circuit are suitable for the current rating of the ESX10-TC used.
- Automatic start-up of machinery after shut down must be prevented (Machinery Directive 98/37/EG and EN 60204-1). In the event of a short circuit or overload the load circuit will be disconnected electronically by the ESX10-TC.
- Refer to UL file for proper wiring and installation techniques.

Dimensions

Time/Current characteristic curve ( $T_a = 25\text{ }^\circ\text{C}$ )

† current limitation typically  $1.8 \times I_n$  times rated current at  $I_n = 1.0\text{ A} \dots 6\text{ A}$   
 current limitation typically  $1.5 \times I_n$  times rated current at  $I_n = 10\text{ A}$

- The trip time is typically 3 seconds in the range between  $1.1$  and  $1.8 \times I_n$ †.
- Electronic current limitation occurs at typically  $1.8 \times I_n$ † which means that under all overload conditions (independent of the power supply and the resistance of the load circuit) the max. overload before disconnection will not exceed  $1.8 \times I_n$ † times the current rating. Trip time is between 100 ms and 3 sec (depending on overload or at short circuit).
- Without this current limitation a considerably higher overload current would flow in the event of an overload or short circuit.

Accessories for ESX10-TC

5 ESX10-TC with busbars

**Mounting procedure:**

Before wiring, insert busbars into protection block.  
Max. 10 insertion/removal cycles for busbars.

**Recommendation:**

Every 10 units busbars should be interrupted and fed in anew.

**Table of lengths for busbars:**

(see accessories)
